

## **Please die within working hours: periodicity of cardiovascular deaths in Switzerland**

<sup>1</sup>Marques-Vidal P., <sup>2</sup>Reavey M.

*CHUV and University of Lausanne<sup>1</sup>, Faculty of Biology and Medicine, University of Lausanne<sup>2</sup>*

**Purpose:** Several studies have previously suggested periodical patterns in mortality rates from cardiovascular disease (CVD), acute myocardial infarction (AMI) and stroke. The aim of this study was to see if there was such a phenomenon and its significance in the Swiss population between the years 1969 and 2007.

**Methods:** Swiss mortality data from 1969 to 2007 (2'362'430 deaths) were used. Number of deaths and mortality rates due to CVD, AMI and stroke were computed for the time of day, day of the week, and month. A further stratification on gender or age (<65 and ≥65 years old) was also performed.

**Results:** There was a clear variability on CVD, AMI and stroke mortality rates according to the time of day, day of the week and the month. In general, mortality peaked in the morning (8h00-12h00) and also in the late afternoon (14h–18h), while the nadir occurred during the nightly hours. Both males and females showed similar hourly patterns, although the trend diminished in older patients, particularly regarding death from stroke. Weekly variation of mortality rates was also found for the younger (<65 years) subjects, with the lowest mortality rates on Sundays and the highest on Mondays. Conversely, seasonal variation according to month was stronger in the elder subjects, with the highest mortality rates during the winter and the lowest in the summer (July/August).

**Conclusion:** There is a timely pattern to death rates for CVD, AMI and stroke in Switzerland depending on the age and sex of the patients. Knowing this trend, its triggering factors and consequences, measures could put in place to prevent, diagnose and treat the population at certain times.

## Message of the Vice-Dean for Research

Dear Friends and Colleagues,

On behalf of the Organizing Committee I would like to welcome you to the ninth edition of the CHUV Research Day, which will be dedicated to cardiology and metabolism. Clinical and research development in both fields has been given high priority at the CHUV and UNIL, and the coming years should see significant progress toward the establishment of corresponding clinical and research centres.

Growing evidence indicates that inflammation is causally related to obesity and diabetes. Thus, obesity is associated with low grade systemic inflammation that constitutes one of the mechanisms underlying obesity-associated morbidity. Moreover, chronic inflammation is a significant risk factor for the development of cardiovascular and metabolic disease and continuous secretion of factors such as TNF $\alpha$  and IL-6 is associated with increased risk for numerous chronic diseases including insulin resistance, atherosclerosis and type 2 diabetes.

Given that obesity is a complex disorder, a multidisciplinary approach is necessary to unravel its pathogenesis and underlying mechanisms. The use of numerous « omic » technologies including genomics, proteomics and metabolomics is becoming essential in order to identify inflammatory biomarkers that may be implicated in the pathogenesis of obesity and the mechanisms that link the increase in adipose mass to morbidity. Once identified, elucidation of the role of the relevant inflammatory factors in the various disorders related to obesity will be essential.

Among cardiovascular diseases, atherosclerosis is linked not only to inflammation but to an adaptive immune response as well. However, whereas the role of Th1 lymphocytes in atherogenesis is well established, less is known about the role of other T cell subsets, including Th2 and Th17. Elucidation of the full repertoire of mechanisms whereby adaptive immunity enhances atherogenesis will no doubt be important.

The program to which you have been invited will cover a variety of aspects of the implication of inflammation and immunity in obesity and atherogenesis with a view as to possible novel therapeutic approaches down the line.

I would like to thank the Scientific Committee for putting together a high quality program with a superb panel of guest speakers and hope that you will find the event to be both stimulating and enjoyable.

Ivan Stamenkovic  
Vice-Doyen for Research

## Message du Vice-Doyen de la Recherche

Cher(e)s Collègues, Cher(e)s Ami(e)s,

Je vous souhaite la bienvenue à la neuvième édition de la Journée de Recherche CHUV dont les thématiques sont la cardiologie et le métabolisme. Ces thématiques représentent des domaines de développement prioritaires du CHUV et de l'UNIL et prennent une importance croissante dans notre Faculté.

Les développements récents dans le domaine du métabolisme indiquent que l'inflammation joue un rôle important dans l'obésité et dans le diabète. Ainsi, l'obésité est associée à un état inflammatoire systémique chronique de bas grade qui constitue l'un des mécanismes potentiels impliqué dans les complications de l'obésité. L'inflammation chronique de bas grade est un facteur de risque significatif pour les maladies cardiovasculaires et métaboliques, et la sécrétion continue des médiateurs tels que le  $TNF\alpha$  et l'IL-6 est associée à un risque augmenté pour de nombreuses maladies chroniques y compris la résistance à l'insuline, l'artériosclérose et le diabète de type II.

La physiologie de l'obésité étant complexe, il est évident qu'une approche multidisciplinaire est nécessaire pour comprendre son processus et les mécanismes qui y conduisent. L'utilisation de nouvelles technologies, y compris la génomique, la protéomique et la métabolomique devient indispensable afin d'identifier les biomarqueurs inflammatoires qui pourraient être impliqués dans la pathogénèse de l'obésité ainsi que dans les mécanismes moléculaires qui lient l'augmentation la masse du tissu adipeux aux dysfonctions de l'organisme. Il est de ce fait essentiel de comprendre le rôle des différents facteurs inflammatoires dans les affections liées à l'obésité.

Parmi les maladies cardiovasculaires, la pathogénèse de l'artériosclérose est intimement liée à la réponse immune adaptative. Toutefois, alors que le rôle athérogène des lymphocytes Th1 est bien établi, celui des autres sous groupes lymphocytaires T, y compris Th2 et Th 17 l'est moins mais de plus en plus de données suggèrent que ces lymphocytes participent à la régulation de l'artériosclérose et l'élucidation de leur mécanisme d'action sera d'importance.

Le programme auquel vous êtes conviés fait le point sur les approches actuelles de l'analyse de la réponse inflammatoire et immune dans l'obésité et dans l'artériosclérose et examine les voies thérapeutiques possibles.

Je tiens à remercier les membres du comité scientifique pour avoir établi un programme stimulant et de très haute qualité et je vous souhaite de passer une journée agréable.

Ivan Stamenkovic  
Vice-Doyen de la Recherche

Schedule	Names & Departments	Titles
<b>Morning</b>		
10h15 - 10h30	<b>Stefan KOHLER</b> PACTT – UNIL/CHUV	<i>From the lab to the market: Commercialisation of research results</i>
10h30 – 10h45	<b>Cécile JACOVETTI</b> Department of Cellular Biology and Morphology - UNIL	<i>The role of micro-RNAs in beta-cell mass expansion during pregnancy</i>
10h45 – 11h00	<b>Pedro MARQUES-VIDAL</b> Social and Preventive Medicine CHUV	<i>Prevalence and management of cardiovascular risk factors among migrants in Switzerland</i>
11h00 – 11h15	<b>Francesca AMATI</b> Department of Physiology - UNIL and Service of Endocrinology, Diabetology and Metabolism - CHUV	<i>Skeletal muscle mitochondrial content and electron transport chain activity in older adults at risk for type 2 diabetes: relationship to insulin sensitivity, metabolic flexibility and fatty acid oxidation</i>
11h15 – 11h30	<b>Evrin JACCARD</b> Departement of Physiology UNIL	<i>Involvement of the RasGAP-derived fragment N in the resistance of pancreatic beta cells towards apoptosis</i>
11h30 – 11h45	<b>Luca CARIOLATO</b> Institute of Pharmacology and Toxicology - UNIL	<i>Characterization of novel hypertrophic pathways activated by the AKAP-Lbc signalling complex in cardiomyocytes</i>
<b>Afternoon</b>		
14h15 – 14h30	<b>Sasha HUGENTHOBLER</b> Euresearch	<i>European funding opportunities for health and health related research</i>
14h30 – 14h45	<b>Mohammed NEMIR</b> Experimental Cardiology Unit CHUV	<i>Cardiac-specific overexpression of the Notch ligand Jagged1 reduces cardiac hypertrophy and fibrosis in response to hemodynamic stress</i>
14h45 – 15h00	<b>Hoshang FARHRAD</b> Service of Nuclear Medicine CHUV	<i>Myocardial Blood Flow Quantification with Rubidium-82 Cardiac PET has Incremental Prognostic Value in Patients with Known or Suspected Coronary Artery Disease</i>
15h00 - 15h15	<b>Muriel AUBERSON</b> Department of Pharmacology and Toxicology - UNIL	<i>GLUT9 and uric acid handling by the kidney</i>
15h15 - 15h30	<b>Fabienne MAURER</b> Service of Medical Genetics CHUV	<i>Mapping genetic variants associated to beta-adrenergic responses in inbred mice</i>
15h30 – 15h45	<b>Maxime PELLEGRIN</b> Service of Angiology CHUV	<i>Critical role of Angiotensin II type 1 receptor on bone marrow-derived cells in the development of vulnerable atherosclerotic plaque in 2-Kidney, 1-Clip ApoE<sup>-/-</sup> mice</i>
