Objective: In view of increasing prevalence of obesity worldwide, we examined the associations between cardiovascular risk factors (CVRF) and several adiposity markers among young adults in the Seychelles.

Methods: In 549 participants aged 19-20 years from a population-based cohort study (Seychelles Child Development Study), we assessed health behaviors through questionnaire and measured weight, height, waist, fat mass (bioimpedance), blood pressure (BP), as well as blood lipids and glucose and uric acid on fasting blood. Analyses were made separately in males and females.

Results: The prevalence of several CVRFs was elevated. BMI was strongly associated with CVRFs. The standardized regression coefficients ranged between 0.25-0.40 for systolic and diastolic BP, triglycerides, uric acid, and blood glucose (females) and between 0.15-0.26 for HDL-cholesterol and LDL-cholesterol (males). The odds ratios (contrasting the highest vs. two other tertiles for both BMI and the considered CVRFs) ranged between 6-12 for systolic/diastolic BP and between 2.5-6 for glucose, triglyceride and uric acid. Overall, associations with the CVRFs were not markedly different based on BMI, waist circumference or fat mass but tended to be weaker with waist/hip ratio. Estimates were only minimally altered upon adjustment for smoking, alcohol intake, physical activity and parents’ socio economic status.

Conclusion: The elevated prevalence of several main CVRFs in youths emphasizes the importance of a life course approach to cardiovascular disease prevention. Our findings show strong associations between adiposity and several CVRFs in this population in the African region and suggest that BMI and waist circumference are equally useful markers.

Message of the Vice-Dean for Research

Dear Friends and Colleagues,

On behalf of the Organizing Committee I would like to welcome you to the ninth edition of the CHUV Research Day, which will be dedicated to cardiology and metabolism. Clinical and research development in both fields has been given high priority at the CHUV and UNIL, and the coming years should see significant progress toward the establishment of corresponding clinical and research centres.

Growing evidence indicates that inflammation is causally related to obesity and diabetes. Thus, obesity is associated with low grade systemic inflammation that constitutes one of the mechanisms underlying obesity-associated morbidity. Moreover, chronic inflammation is a significant risk factor for the development of cardiovascular and metabolic disease and continuous secretion of factors such as TNFα and IL-6 is associated with increased risk for numerous chronic diseases including insulin resistance, atherosclerosis and type 2 diabetes.

Given that obesity is a complex disorder, a multidisciplinary approach is necessary to unravel its pathogenesis and underlying mechanisms. The use of numerous «omic» technologies including genomics, proteomics and metabolomics is becoming essential in order to identify inflammatory biomarkers that may be implicated in the pathogenesis of obesity and the mechanisms that link the increase in adipose mass to morbidity. Once identified, elucidation of the role of the relevant inflammatory factors in the various disorders related to obesity will be essential.

Among cardiovascular diseases, atherosclerosis is linked not only to inflammation but to an adaptive immune response as well. However, whereas the role of Th1 lymphocytes in atherogenesis is well established, less is known about the role of other T cell subsets, including Th2 and Th17. Elucidation of the full repertoire of mechanisms whereby adaptive immunity enhances atherogenesis will no doubt be important.

The program to which you have been invited will cover a variety of aspects of the implication of inflammation and immunity in obesity and atherogenesis with a view as to possible novel therapeutic approaches down the line.

I would like to thank the Scientific Committee for putting together a high quality program with a superb panel of guest speakers and hope that you will find the event to be both stimulating and enjoyable.

Message du Vice-Doyen de la Recherche

Cher(e)s Collègues, Cher(e)s Ami(e)s,

Je vous souhaite la bienvenue à la neuvième édition de la Journée de Recherche CHUV dont les thématiques sont la cardiologie et le métabolisme. Ces thématiques représentent des domaines de développement prioritaires du CHUV et de l’UNIL et prennent une importance croissante dans notre Faculté.

Les développements récents dans le domaine du métabolisme indiquent que l’inflammation joue un rôle important dans l’obésité et dans le diabète. Ainsi, l’obésité est associée à un état inflammatoire systémique chronique de bas grade qui constitue l’un des mécanismes potentiels impliqué dans les complications de l’obésité. L’inflammation chronique de bas grade est un facteur de risque significatif pour les maladies cardiovasculaires et métaboliques, et la sécrétion continue des médiateurs tels que le TNFα et l’IL-6 est associée à un risque augmenté pour de nombreuses maladies chroniques y compris la résistance à l’insuline, l’artériosclérose et le diabète de type II.

La physiologie de l’obésité étant complexe, il est évident qu’une approche multidisciplinaire est nécessaire pour comprendre son processus et les mécanismes qui y conduisent. L’utilisation de nouvelles technologies, y compris la génomique, la protéomique et la métabolomique devient indispensable afin d’identifier les biomarqueurs inflammatoires qui pourraient être impliqués dans la pathogénèse de l’obésité ainsi que dans les mécanismes moléculaires qui lient l’augmentation la masse du tissu adipeux aux dysfonctions de l’organisme. Il est de ce fait essentiel de comprendre le rôle des différents facteurs inflammatoires dans les affections liées à l’obésité.

Parmi les maladies cardiovasculaires, la pathogénèse de l’artériosclérose est intimement liée à la réponse immune adaptative. Toutefois, alors que le rôle athérogène des lymphocytes Th1 est bien établi, celui des autres sous groupes lymphocytaires T, y compris Th2 et Th 17 l’est moins mais de plus en plus de données suggèrent que ces lymphocytes participent à la régulation de l’artériosclérose et l’élucidation de leur mécanisme d’action sera d’importance.

Le programme auquel vous êtes conviés fait le point sur les approches actuelles de l’analyse de la réponse inflammatoire et immune dans l’obésité et dans l’artériosclérose et examine les voies thérapeutiques possibles.

Je tiens à remercier les membres du comité scientifique pour avoir établi un programme stimulant et de très haute qualité et je vous souhaite de passer une journée agréable.
