Appendix S3: Macroecological models results

All model techniques had a R-squared comprised between 0.6 and 0.7. The table ranks the importance of the variables for each modelling technique from the most important to the least (1 to 5): growing degree-days (GDD), moisture index over the growing season (MI), the sum of solar radiations over the year (RAD), slope (S), and topography (T).

	GLM	GAM	GBM
1	GDD	GDD	GDD
2	T	S	MI
3	S	MI	T
4	RAD	RAD	S
5	MI	T	RAD

Appendix S4: Boxplots comparing predictions from SSDM and SSDM-MEM on the basis of Sensitivity (sens) and Specificity (spec) indices.

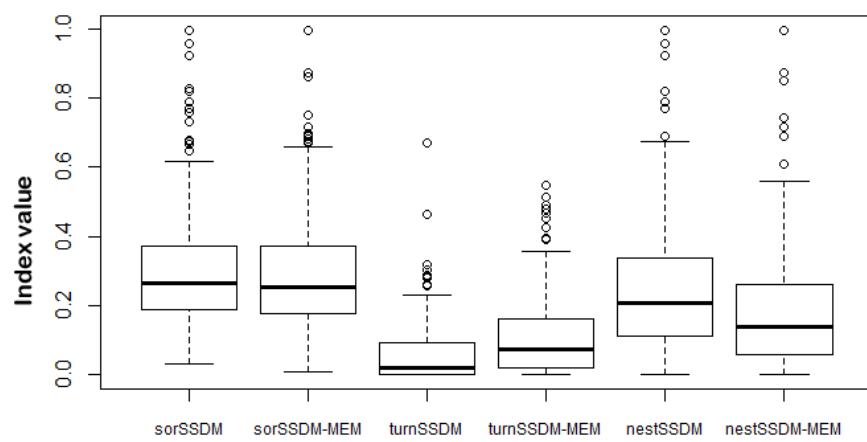

Appendix S5. Boxplots comparing predictions from SSDM and SSDM-MEM for the taxonomic (A), functional (B) and phylogenetic (C) diversity components, on the basis of the Sørensen dissimilarity index (sor) and its components, richness difference (turn) and species replacement (nest).

Appendix S6. Variation of the root mean square error (RMSE) for SSDM (green) and SSDM-MEM (red) predictions for the functional (circles) and phylogenetic (triangles) diversity indices for different similarity δ values.

Appendix S7: Values of ρ Spearman correlation between observed and predicted FD and PD indices, both for SSDM-MEM and SSDM approaches, at each similarity parametrization (δ values).
