Abstract

In addition to the monographs which have been published recently by the working group “Drug Monitoring” of the Swiss Society of Clinical Chemistry (SSCC) [1, 2], new monographs have been written. The aim of these monographs is to provide an overview on the information which is important for the request and interpretation of the results. Therefore, the targeted readers are laboratory health professionals and the receivers of the reports. In this series, aminoglycoside as well as glycopeptide antibiotics are presented. In addition, two antimycotic drugs, which are regularly quantified in sera of intensive care patients, are described. Also, the monograph on mebendazole is shown. This drug is often used in high doses for the treatment of infections with *Echinococcus multilocularis* for which the measurement of drug concentrations in serum is recommended. Information on the indication for therapeutic drug monitoring (TDM), protein binding, metabolic pathways and enzymes involved, elimination half-life and elimination routes, and therapeutic or toxic concentrations is provided. Because pre-analytical considerations are of particular importance for therapeutic drug monitoring, there is also information given at which time the determination of the drug concentration is reasonable and when steady-state concentrations are reached after changing the dose. Furthermore, the stability

of the drug and its metabolite(s) after blood sampling is described. For readers with a specific interest, references to important publications are provided. The number of the monographs will be continuously increased. The updated files are presented on the homepage of the SSCC (www.sccc.ch). We hope that these monographs are helpful for the better handling of therapeutic drug monitoring and we are looking forward to comments by the readers.

Keywords: amikacin; gentamicin; itraconazole; mebendazole; netilmicin; teicoplanin; tobramycin; vancomycin; voriconazole.

Zusammenfassung

In Ergänzung zu den in den letzten Jahren publizierten Arzneimittelmonographien der Arbeitsgruppe Medikamente der Schweizerischen Gesellschaft für Klinische Chemie (SGKC) [1, 2], sind nun weitere Monographien erstellt worden. Ziel dieser Monographien ist es, dem Labormediziner bzw. dem Empfänger der Befunde eine Übersicht über die wichtigsten Informationen zu geben, die für die Veranlassung einer Analyse bzw. für die Interpretation der Resultate hilfreich sind. In dieser Serie werden die Aminoglykosid- und Glykopeptidantibiotika präsentiert, wie auch zwei Antimykotika, bei denen vor allem bei Intensivpatienten immer häufiger Messungen im Serum durchgeführt werden. Zusätzlich wird die Monographie von Mebendazol präsentiert, das im Rahmen der Infektionen mit *Echinococcus multilocularis* (Fuchsbandwurm) in hohen Dosen verabreicht und im Serum bestimmt wird. In den einzelnen Monographien werden klinisch pharmakologische Angaben wie zum Beispiel Indikation für das Therapeutic Drug Monitoring (TDM), Proteinbindungen, Metabolisierungswege und daran beteiligte Enzyme, Halbwertszeiten und Eliminationswege der Muttersubstanz, sowie Informationen zu therapeutischen bzw. toxischen Bereichen, zur Verfügung gestellt. Da die Präanalytik gerade beim Therapeutic Drug Monitoring eine wichtige Rolle spielt werden auch hier Angaben gemacht zu welchem Zeitpunkt eine Bestimmung der Arzneimittelkonzentration sinnvoll ist und wann, nach einer Dosisänderung, der steady-state erreicht ist. Außerdem werden Angaben über die Stabilität der Medikamente bzw. ihrer Metaboliten nach der

Blutentnahme gemacht. Für die interessierten Leser sind die verwendeten Referenzen als Zitate aufgeführt. Die Zahl der Monographien wird fortlaufend ergänzt. Die aktuellsten Versionen der Monographien sind auf der Homepage der SGKC abrufbar (www.ssgc.ch). Wir hoffen, dass diese Monographien im Umgang mit dem Ther-

apeutic Drug Monitoring hilfreich sein werden und freuen uns über Kommentare und Bemerkungen.

Schlüsselwörter: Amikacin; Gentamicin; Itraconazol; Mebendazol; Netilmicin; Teicoplanin; Tobramycin; Vancomycin; Voriconazol.

Amikacin

General

- Class of the drug
- Synonym(s)
- Common trade name(s) in Germany
- Conversion factors

Aminoglycoside antibiotics

–

Biklin®

$\text{mg/L} \times 1.71 = \mu\text{mol/L}$
 $\mu\text{mol/L} \times 0.58 = \text{mg/L}$

Clinical pharmacology

- Indications for TDM
- Protein binding
- Elimination half-life
- Volume of distribution
- Metabolism
 - Main metabolic pathways
 - Active metabolite(s)?
 - Inhibitor or inducer of the cytochrome P450 system?
 - Other significant pharmacokinetic interactions
- Elimination of parent drug
- Typical therapeutic range
- Potentially toxic concentration

Individual dose adaptation, suspicion of toxicity, side effects

4–11% (albumin)

1–4 h

Neonates/infants: 3–8 h (see remarks)

0.3–0.4 L/kg

No metabolism

None

No

None

Renal 100%

Multiple dosing

Peak concentration: 20–30 mg/L (34–51 $\mu\text{mol/L}$)

Trough concentration: $\leq 7 \text{ mg/L} (\leq 12 \mu\text{mol/L})$

Once-daily dosing

Trough concentration: $\leq 1.5 \text{ mg/L} (\leq 2.6 \mu\text{mol/L})$

Multiple dosing

Peak concentration: $> 35 \text{ mg/L} (> 60 \mu\text{mol/L})$

Trough concentration: $> 10 \text{ mg/L} (> 17 \mu\text{mol/L})$

Once-daily dosing

Trough concentration: $> 1.5 \text{ mg/L} (> 2.6 \mu\text{mol/L})$

Pre-analytics

- Time to steady-state since beginning of treatment or change of posology
- Time for blood sampling
- Type(s) of sample
- Stability

Steady-state is generally achieved after 3 doses for multiple dosing

Peak: 1 h after beginning of infusion

Trough: within 30 min of next dose

Once-daily dosing: trough level only

Serum or plasma

1 week at 4°C

When combined therapy with penicillins and/or cephalosporins: in vitro inactivation → freeze sample

Remarks

- Elimination is strongly dependent on renal function
- Avoid gel tubes if possible, unless having confirmed that no binding occurs

Teicoplanin

General	
• Class of the drug	Glycopeptide antibiotics
• Synonym(s)	-
• Common trade name(s) in Germany	Targocid®
• Conversion factors	Not applicable
Clinical pharmacology	
• Indications for TDM	Individual dose adaptation, suspicion of toxicity, side effects
• Protein binding	90% (albumin)
• Elimination half-life	70–150 h Pediatric: 58 h
• Volume of distribution	1.1 L/kg
• Metabolism	No metabolites identified
Main metabolic pathways	None
Active metabolite(s)?	No
Inhibitor or inducer of the cytochrome P450 system?	None
Other significant pharmacokinetic interactions	None
• Elimination of parent drug	Renal (80%)
• Typical therapeutic range	Trough concentration: <15 mg/L
• Potentially toxic concentration	Not known
Pre-analytics	
• Time to steady-state since beginning of treatment or change of posology	Not relevant
• Time for blood sampling	Trough: within 30 min of next dose
• Type(s) of sample	Serum or plasma
• Stability	1 week at 4°C
Remarks	<ul style="list-style-type: none"> • Elimination is strongly dependent on renal function • Avoid gel tubes if possible, unless having confirmed that no binding occurs

Itraconazole**General**

- Class of the drug
- Synonym(s)
- Common trade name(s) in Germany
- Conversion factors

Antimycotics

-

Sempera®

Itraconazole: mg/L \times 1.42 = $\mu\text{mol}/\text{L}$
 $\mu\text{mol}/\text{L} \times 0.71 = \text{mg/L}$ Hydroxyitraconazole: mg/L \times 1.39 = $\mu\text{mol}/\text{L}$
 $\mu\text{mol}/\text{L} \times 0.72 = \text{mg/L}$ **Clinical pharmacology**

- Indications for TDM
- Protein binding
- Elimination half-life
- Volume of distribution
- Metabolism
 - Main metabolic pathways

Individual dose adaptation, verification of compliance
 >99% (albumin)
 1.0–1.5 days
 10.7 L/kg

Active metabolite(s)?

Hydroxylation by CYP3A4 to hydroxyitraconazole
 (stereoselective biotransformation) and a number of other
 metabolites

- Inhibitor or inducer of the cytochrome P450 system?
- Other significant pharmacokinetic interactions
- Elimination of parent drug
- Typical therapeutic range

Hydroxyitraconazole (should be determined as well)

Inhibits CYP3A4

Inhibitor of P-gp

Mainly hepatic

>0.50 mg/L (>0.71 $\mu\text{mol}/\text{L}$) for itraconazole
>1.0 mg/L (>1.42 $\mu\text{mol}/\text{L}$) for itraconazole +
hydroxyitraconazole

- Potentially toxic concentration

Not known

Pre-analytics

- Time to steady-state since beginning of treatment or change of posology
- Time for blood sampling
- Type(s) of sample
- Stability

7–14 days

Before next dose at steady-state

Serum or plasma

Several days at 4°C

Remarks

None

Voriconazole**General**

- Class of the drug
- Synonym(s)
- Common trade name(s) in Germany
- Conversion factors

Antimycotics

-

Vfend®

 $\text{mg/L} \times 2.86 = \mu\text{mol/L}$ $\mu\text{mol/L} \times 0.35 = \text{mg/L}$ **Clinical pharmacology**

- Indications for TDM
- Protein binding
- Elimination half-life
- Volume of distribution
- Metabolism
 - Main metabolic pathways
 - Active metabolite(s)?
 - Inhibitor or inducer of the cytochrome P450 system?
 - Other significant pharmacokinetic interactions
- Elimination of parent drug
- Typical therapeutic range
- Potentially toxic concentration

Individual dose adaptation

58%

Approximately 6 h for 200 mg (non-linear pharmacokinetics)
2–4.6 L/kg

N-oxidation and hydroxylation by CYP2C19, CYP2C9, CYP3A4

None

Inhibits CYP2C19, CYP2C9 and CYP3A4

No

Mainly hepatic

Renal <2%

1–6 mg/L (2.9–17.2 $\mu\text{mol/L}$)

Not known

Pre-analytics

- Time to steady-state since beginning of treatment or change of posology
- Time for blood sampling
- Type(s) of sample
- Stability

5–6 days (approximately 1 day with loading dose)

Before next dose at steady-state

Serum or plasma

Several days at 4°C

Remarks

- Genotype status for CYP2C19 and/or co-administration of drugs that modulate CYP2C19 and CYP3A4 activities could affect voriconazole drug levels
- The target range for CSF (cerebrospinal fluid) and aqueous humor is only 50% of the respective value in serum or plasma, due to missing proteins

Mebendazole

General	
• Class of the drug	Anthelmintics
• Synonym(s)	-
• Common trade name(s) in Germany	Vermox®, Surfont®
• Conversion factors	mg/L × 3.39 = µmol/L µmol/L × 0.295 = mg/L
Clinical pharmacology	
• Indications for TDM	Individual dose adaptation
• Protein binding	90%
• Elimination half-life	2.5–5.5 h
• Volume of distribution	Not known
• Metabolism	Formation of amino- and hydroxymetabolites (larger plasma concentration compared to mebendazole)
Main metabolic pathways	Non-significant activity of major metabolites
Active metabolite(s)?	Inducer of hepatic microsomal oxidizing system (enzyme(s) not known)
Inhibitor or inducer of the cytochrome P450 system?	Not known
Other significant pharmacokinetic interactions	Mainly hepatic
• Elimination of parent drug	>0.074 mg/L (>0.25 µmol/L) for treatment of echinococcosis
• Typical therapeutic range	>1 mg/L (>3.39 µmol/L) should be avoided
• Potentially toxic concentration	
Pre-analytics	
• Time to steady-state since beginning of treatment or change of posology	2–4 days
• Time for blood sampling	4 h after last dose
• Type(s) of sample	Serum or plasma
• Stability	Several days at 4°C
Remarks	<ul style="list-style-type: none"> • The large inter- and intra-individual variability is due to the low bioavailability that is related to the low solubility of mebendazole; bioavailability is increased with concomitant intake of a fatty meal • Cholestasis increases blood levels • Only serum or plasma samples should be shipped (mebendazole is not stable in the collected blood samples)
