4 A Representative Organization?
Ibero-American Networks in
the Committee on Intellectual
Cooperation of the League of
Nations (1922–1939)

Martin Grandjean

Introduction: Organizing “Intellectual Cooperation” After
the First World War

How to choose the people who will coordinate the restructuring of sci-
ence at an international level and promote intellectual exchange after the
First World War? World-renowned scientists whose popularity will “lead
by example”, great academic administrators familiar with institutional
issues or diplomats representing the great victorious powers to secure
political support? This is the question to be answered by the Secretariat
of the League of Nations in the autumn of 1921. The Assembly hav-
ing endorsed the creation of an International Committee on Intellectual
Cooperation (ICIC), the task of the Japanese Under Secretary-General
Inazo Nitobe is to name the twelve most appropriate personalities.

In the context of a nascent League of Nations whose primary mis-
sions are focused on economic issues in a troubled Europe, intellectual
issues are not a priority. Yet, and the development of the first true cultural
diplomacy strategies in several states during the 1920s proves it, these
twelve appointments have an undeniable political character.

The purpose of this article, falling within the framework of our research
on the networks of intellectual cooperation (Grandjean 2018), is to con-
duct a study of the constitution of the ICIC by reversing the focus usually
consisting of commenting on the presence of a few famous personalities
(Albert Einstein, Marie Skłodowska Curie, Henri Bergson, etc.) to ques-
tion the nomination process and to highlight the contribution of several
Ibero-American representatives. Without proposing an exhaustive inven-
tory of all the publications that describe intellectual cooperation, it is
worth noting that most studies either adopt a very institutional approach
like Northedge (1953) or Pham (1962) or focus on international issues,
as in Laqua (2011b) and Laqua (2011a). It is also not uncommon for the
Committee to be mentioned as a cultural actor in the biographies of its
members, without always describing its structure and work with preci-
sion. Moreover, and because of this vagueness, the Paris perspective is
often preferred to the Geneva viewpoint because of the archives of the
International Institute of Intellectual Cooperation (IIIC), later founded in the French capital to assist the ICIC in its work, and considered the ancestor of UNESCO. With regard to Ibero-American personalities, this sometimes implies a focus on the Spanish writer and diplomat Salvador de Madariaga and his involvement in the Institute. It should also be noted that the various projects of the League concerning intellectual cooperation and their relationship with the Iberic and Latin-American world have already been well studied in Pernet (2007), Dumont (2008), Dumont (2012), Roig-Sanz (2013), Pernet (2014), Dumont (2016) and Roig-Sanz (2016). However, the following pages do not attempt to embrace the question of international cultural relations regarding these countries but to take the Committee on Intellectual Cooperation’s microcosm as our object and to question its representativeness. Here, the challenge is to try to understand the appointment mechanism and in particular the notion of “national culture” that is often used to explain the balance between national representatives within the ICIC.

In the following pages, it will be seen that the principle that governs the appointment of these experts has two distinct periods. Foremost, the initial appointment of the first twelve members in 1922 is a kind of test that does not show great diversity. It is only when it comes to replacing resigning members that the Secretariat and the more political bodies of the League attempt to define a systematic renewal method implicitly based on the influence of nations or groups of nations in other instances of the institution.

While we may sometimes seek to explain the genesis of the Committee on Intellectual Cooperation by going back to the internationalist and pacifist movements of the end of the nineteenth century, its creation in the early 1920s has little to do with the great projects of “international universities” or “parliament of intelligences” of the time. At the end of the First World War, the League of Nations is indeed a construction of a new kind that differs very much from the Belle Époque conceptions that saw the flowering of technical congresses and private associations (Grandjean and Van Leeuwen 2019): in this new world order, the Member States centralize their negotiations in a single place that quite bypasses the previous modes of organization. But while the League seeks to embrace all the modalities of a global and peaceful coexistence, it remains an instrument primarily designed to settle economic and political issues. The scientific and intellectual questions are very secondary, and the already tight bookkeeping of the institution will never allow assignment of a significant budget to intellectual cooperation.

But in the momentum of the first years, many are the voices that call to think of international cooperation in all its forms and to integrate the intellectual questions. Chaired by Miguel Gastão da Cunha, representative of Brazil, the meeting of the Council of March 1st, 1921, in Paris,
Cooperation (IIC), later founded IC in its work, and considered the Ibero-American personalities, this Spanish writer and diplomat Salvador in the Institute. It should also be the League concerning intellectual with the Iberic and Latin-American in Pernet (2007), Dumont (2008), Pernet (2014), Dumont (2016) and following pages do not attempt to all cultural relations regarding these on Intellectual Cooperation’s micro- its representativeness. Here, the appointment mechanism and in par- e” that is often used to explain the lives within the ICIC. seen that the principle that governs two distinct periods. At the end of the ns is indeed a construction of a new Belle Époque conceptions that saw and private associations (Grandjean world order, the Member States en- lage that quite bypasses the previous 2 League seeks to embrace all the oexistence, it remains an instrument c and political issues. The scientificondary, and the already tight book- er allow assignment of a significant years, many are the voices that call in all its forms and to integrate the Miguel Gastão da Cunha, representa- council of March 1st, 1921, in Paris, takes note of the report of Quiñones de León on this subject entitled “Organization of intellectual work”. In his report, the representative of Spain recalls that even though

the Covenant is silent on the relations of the League to what may be called voluntary associations of private character [...] , from the general tone of the Covenant we infer that the League should exercise its good offices in the interest of all international undertakings that will contribute to the advancement of good will and mutual understanding among the nations.

This notion of mutual understanding is a fundamental argument in favor of intellectual cooperation, but it is also clear—in the report and subsequent discussions—that the League would prefer that this task continue to be the prerogative of private associations. In the course of the debates, the project of setting up a highly formalized technical organization, like the International Labor Organization, is then gradually revised to prepare the establishment of an advisory committee. On September 8, 1921, the Fifth Commission of the Assembly is finally asked to take a decision on the report by the French senator Léon Bourgeois proposing the creation of the ICIC. On the proposal of the Chilean delegate Manuel Rivas Vicuña, the commission asks the Belgian Henri La Fontaine to make a presentation on the question of intellectual work. Co-founder of the Union of International Associations (UIA), this Nobel Peace Prize laureate is well placed to talk about it since he has been fighting for many years with his colleague Paul Otlet for these issues to be taken into consideration (Rayward 2003), (Laqua 2009). Presenting how their Belgian experiments can be a source of inspiration, he expresses “the ardent hope that the League of Nations can build itself on existing foundations”, implying that the UIA could become an official satellite of the League. But rather than prepare for the creation of a very bureaucratic structure in Geneva or the integration of Belgian institutions, the ICIC adopted with Bourgeois’s report of autumn 1921 will gradually be stabilized by acquiring a permanent status but keeping its more deliberative rather than executive nature. In fact, the Committee as such has above all the merit of bringing together personalities from various horizons and sending a signal to the world of science and culture. However, it has never had the means to go far beyond this relatively symbolic role since its missions have never been precisely defined and because its small size made it a place whose continuity was very dependent on the personalities that compose it. The name of the Committee itself is also a symbolic element of this indecision. The difficulty of defining precisely what “intellectual cooperation” is can be considered an element that prefigures the future complications when it will come to agreeing on concrete actions to be
carried out under such a label. In an internal note of 1922, Inazo Nitobe thus recalls the terminological wandering of the first years:

In French the term “Organization internationale du Travail intellectuel” was consistently used; but in English this Committee has been called by various names, giving rise to a good deal of misunderstanding. In the Assembly resolution the term “International Organization (sometimes ‘Coordination’) of Intellectual Work” was used, and this title was adopted in the earlier documents relating to it. It naturally led to a mistaken idea that the object of the Committee was to start an organization something like the International Labour Office for intellectuals [. . .]. This notion has continued long and spread widely. Then it was also believed by outsiders that the Committee would deal with questions of education, and hence terms such as “Committee on International Education”, “Intellectual Intercourse and Education”, and “Intellectual Development Committee” were used by correspondents.

He adds that the Secretariat had taken an active role in stabilizing this new nomenclature. In order to avoid misunderstanding and to “better assert the character of the committee”, he admits in this note that he has systematized the use of the term “intellectual cooperation” in the Secretariat’s correspondence. However, this term is very strongly marked by the will of some delegates—French in particular—to make this committee a body that deals with educational issues related to the need to build a world of mutual understanding. In fact, the ICIC concentrated on coordinating scientific and cultural exchanges in circles wishing to be associated with its work (all the learned societies and international organizations created before the war did not necessarily look favorably on the centralization induced by the League).

The Appointment of the First Committee: Priority to Personalities Over Nationality

Beginning the designation process in December 1921, Inazo Nitobe writes to the Secretary General Eric Drummond that “the committee should be as small as possible, for economic reasons and efficiency”. He recommends that it should be composed of only seven or eight members, while the resolution allows the appointment of twelve experts. In the same note, he finds “highly desirable that an American and a German be invited”, if possible directly by the Council as a mark of good will towards these two nations, which have not joined the League. Very concretely, he envisages the participation of personalities from the following countries: Great Britain, France, Italy, Belgium, Colombia, India and Norway, and why not also Spain, Czechoslovakia and Austria. The under-secretary general

erican and a German be invited”, if
ark of good will towards these two
leagues. Very concretely, he envisions
n the following countries: Great
ambia, India and Norway, and why
Austria. The under-secretary general
specifies that the representative of Norway could be a woman, indicating
that he already thinks about the candidature of the zoologist Kristine
Bonnevie, member of her national delegation to the League. It is obvious
that the selection of certain other countries in this list is also due to infor-
and convincing applications (Colombia, India, Norway or Czecho-
lovakia aren’t prominent members during the first years of the League).

On the morning of January 14, 1922, the twelfth meeting of the six-
teenth session of the Council is not yet ready to make the appointments
as initially planned, but Nitobe has already started to put names on a list
that remains confidential. This list will increase in the following months:
ate the end of March, no less than fifty-eight names are communicated to
the Council (they are followed by a dozen other late proposals). Since
this list serves as a basis not only for the composition of the ICIC of 1922
(it already contains most of the members who will actually be appointed)
but will also later be a pool of candidates, it is worthwhile to look at the
representation of Ibero-American personalities within it.

Among them are Cecilio Báez, Paraguayan professor of international
law and Rector of the University of Asunción; the former Portuguese
Prime Minister Afonso Costa, director of the Faculty of law at the Uni-
versity of Lisbon; the Ambassador of Colombia in Bern, Francisco-José
Urrutia Olano, who will then sit at the Permanent Court of International
Justice; or the Brazilian law professor Francisco José de Oliveira Viana.
But not all of them are lawyers, as there are also representatives of the
sciences, like the Spanish professor of histology Santiago Ramón y Cajal,
also president of the Junta para Ampliacion de Estudios; the engineer
Leonardo Torres y Quevedo, director of the Electrico-Mecanico labora-
tory of Madrid, the former director of the Museo Nacional of Buenos
Aires and the Argentinian Consejo de Educacion Angel Gallardo or the
Brazilian Aloysio de Castro, director of the faculty of medicine of the
University of Rio de Janeiro. On the humanities side, Uruguayan Carlos
Vaz Ferreira, philosophy lecturer at the University of Montevideo, and
Spanish philology professor Ramón Menéndez Pidal are also listed.

Despite this inventory, Spanish-speaking and Portuguese-speaking per-
sonalities are largely underrepresented among the candidates. They rep-
resent only 14% of the list, while the founding members of the League
of Nations have seventeen Iberian and Latin American countries out of
forty-two (40%). However, at this point, it appears that if everyone
within the Secretariat agrees to consider that personal skills of a can-
didate qualify him more than his nationality, the wish to select leading
scientists is quickly overtaken by the very empirical constitution of this
list. Even if Léon Bourgeois declares a few months later, at the award
ceremony of his Nobel Peace Prize, that the ICIC is “a Committee com-
posed of the most eminent scientists, the widest and highest intelligences”
(Haberman 1972), the composition of the ICIC is mainly the product of a
bargain between the diplomats searing in the Council of the League.
Moreover, as the definition of the ICIC is not clear for everyone in these early years, the profiles are extremely diverse. Then, the status of their applications is quite variable: if some names are proposals or suggestions from third parties that do not engage the person concerned, others are formalized applications, as this is the case for the French philosopher Henri Bergson, who explicitly gives his approval to his Ministry of Foreign Affairs (Renollet 1999, 23). But even if all the personalities that appear on this document are not mentioned for the same reasons, some having been registered following the prospects of the Secretariat and others because they are parachuted by governments that see there a good opportunity to take part of the decisions on this matter, this list is a fundamental tool for Inazo Nitobe. A detailed analysis of these profiles shows that beyond the twelve scientists appointed in 1922, at least thirteen others will participate in the work of the Committee, of which eight will do so very directly as members or substitutes (Grandjean 2018, 539–541). This list, even imperfect, is therefore a reservoir, a resource that will be mobilized by the Secretariat for several years.

But while the very unequal representation of nations in this list might suggest that the future ICIC itself will be composed in the same way, it must not be forgotten that the implicit rule of national quotas (one representative per country) could, on the contrary, prejudice countries with a large number of candidates competing with each other. We can therefore see this list as a testimony to the interest of nations in intellectual cooperation, more than an estimate of their immediate influence on the appointment decision. The low proportion of Ibero-American candidates therefore seems to reflect above all the moderate interest of intellectual cooperation (or its centralization by the League) in these circles. It also indicates that nationals of these countries have generally fewer relays in Geneva and within the League than some of their colleagues. In the end, the wide variety of backgrounds and the international reputation of a small number of the candidates facilitate the decision of the Council, as Nitobe recalls some months after the appointment: “As the list contained names very well-known in each country, there was little difficulty in the Council making a choice”.

On May 15th, 1922, the Council holds at Geneva the seventh meeting of its eighteenth session under the presidency of Quínones de León and adopts a new report by Léon Bourgeois. In the wake, eleven people are appointed to sit in the new ICIC, the Council keeping the possibility to appoint a twelfth thereafter, in order to have some time to evaluate a North American candidacy. Among the Ibero-American candidates, Aloysio de Castro and Leonardo Torres y Quevedo have been selected. The Brazilian and the Spanish will sit at the same table as the French-Polish chemist Marie Skłodowska Curie, the Belgian Minister Jules Destrée, the German physicist Albert Einstein, the Italian senator Francesco Ruffini, the British philologist Gilbert Murray, the Swiss professor of
ICIC is not clear for everyone in Remmel.
of the notion of “intellectual cooperation” exist according to whether one has a French, Belgian, Scandinavian or Anglo-Saxon view (Saikawa 2014). In the fall of 1923, the ICIC, aware of this problem, tries to clarify its own representativity principle: “it is desirable [...] for the Committee to include, as far as possible, representatives of the principal branches of intellectual activity and at the same time representatives, not of nationalities, but of the principal cultural groups.” While this notion of “culture” or “cultural group” may seem obscure or very reductive today, it is perfectly in tune with the context of the League of Nations at the time. Already in the 1920s, but even more after the Second World War, the institution (and the ICIC with it) is often analyzed as a place of opposition between Latin and Germanic (or Anglo-Saxon) cultures. Intellectual cooperation is also often considered to be monopolized by the Latins, and in particular by France since the creation of the IIC in Paris in 1926. However, even if the Committee does have a majority of representatives of the very large Latin cultural group during the 1920s, this trend subsequently diminished in the 1930s (Grandjean 2018, 295). And to use this criterion implies that there is some kind of unity among the nations concerned, which is anything but obvious. Moreover, hiding behind these so-called “cultural groups” to justify the composition of the ICIC is hard to defend since three-quarters of its first members come from Western Europe. With the exception of a Brazilian, an American and an Indian (Bannerjea works, however, in Germany), all the personalities summoned in 1922 come from a region that represents only a small proportion of the world’s population. This distribution is not surprising compared to the main centers of scientific activity of the early twentieth century; it reflects the lack of diversity of the members of the Council.

Less than a year after the appointment of the Committee, the question of representation becomes an internal policy issue since the Assembly of the League is seized by “legitimate requests formulated by the Romanian, Serbian-Croat-Slovene and Czechoslovakian, Spanish-speaking Americans, Asians, as well as Irish and Finno-Ugric delegates”, questioning the diversity of the ICIC and proposing to include representatives of nations or groups concerned. The intense debates of the Fifth Commission of the Assembly on this subject do not lead to concrete measures—integrating the representatives of all the States wishing to participate is not realistic—but shows the growing interest of nations hitherto neglected.

Yet this concern for cultural diversity and its expression at the Assembly is complex. Indeed, these delegates offer the representatives of the “old nations” an argument that could be turned against them since they have spontaneously gathered together by region or language group to submit their resolution. De facto, one could consider that if a “Spanish-speaking American” personality sits in the ICIC, more than a half of the continent could be considered represented if it is agreed that it forms a single “cultural group”.
An increase in the number of members seems anyway inevitable to allow better representation, to organize rotations within these more or less defined groups. This extension is already perceived as a victory. In an enlaced speech, the Romanian writer Elena Văcărescu welcomes this decision while positioning herself as the spokesperson of South America, Asia and Eastern Europe. She is joined by the Venezuelan delegate, the historian and diplomat Caracciolo Parra-Pérez, who recalls “the growing interest that several [Spanish-speaking American] countries have for the development of intellectual relations between peoples”.

As the discussion continues, the Portuguese delegate João Pinheiro Chagas, diplomat and journalist, puts more particularly the emphasis on the principle of representation and confesses bitterly “to be a little surprised to have to note that the question of whether a State has a culture enabling it to be included in an intellectual committee depends on a more or less benevolent judgment of the Council.”

However, increasing the representativeness of the Committee without jeopardizing its fragile budget is a project made all the more difficult as travel is a cost item proportional to the remoteness of the countries concerned. And they are naturally far away since the main countries of Western Europe are already represented in the ICIC. This budgetary issue is of great concern to the Secretariat, and several extra-European appointments will be discussed in financial terms. The discussion concerning the integration of a Chinese representative in 1926 is a good example: “the nomination of a Chinese member in the ICIC would be possible if the Chinese government refrained from inciting other countries to make the same demands at the Assembly.”

For some time, therefore, the lack of representativeness is reduced by the appointment of “correspondents”, who attend the meetings without being paid by the League.

But that same summer 1924, the ICIC already gathers fourteen members. It turns out that the unexpected return of Albert Einstein, whose seat has meanwhile been assigned to his former Dutch professor Hendrik Lorentz, pushes the Council to reintegrate him without waiting for the departure of another member. Inspired by this example, the delegate of Uruguay asks the Council to appoint a representative of the Spanish-speaking American nations (Brazil and Spain are already represented): on June 16, Leopoldo Lugones, editor of La Nación (Buenos Aires) and professor of aesthetics at the National University of La Plata, is appointed by the Council, bringing to three the number of Ibero-American personalities (see Figure 4.1).

Gradually, this very subjective functioning is adopted, and the first renewals show that it becomes obvious that the Council tries to maintain a certain balance: when a member resigns, he is replaced by a national of the same country or of a neighboring country. This is the case when preparing the succession of Torres y Quevedo in 1926: the Spanish ambassador Quiñones de León takes the lead and insists on being replaced by
Figure 4.1: Composition of the International Committee on Intellectual Cooperation between 1922 and 1939, Highlighting the Ibero-American Personalities (Black).

someone who will bring "the reflection of the Spanish intellectuality" to the IGIC. This episode is interesting for two reasons: first, it explicitly shows that the cultural emission, whether for the representation of "Spanish-speaking American nations", or "Spanish intellectuality", is
fully integrated by the diplomats who renew members. Second, it highlights the existence of a two-tier system between nations having a fixed seat and those that share one: the inflexibility of the main European powers forces the ICIC to grow rather than replace from time to time a French, British, Italian, German or Spanish representative with a personality from a less involved country.

All this contributes to the establishment of a certain “rhythm” for the Committee that leaves its temporary status in the summer of 1926 to become a permanent body of the League of Nations. With this stabilization, the term of office is officially fixed at five years (it was not fixed as long as the Committee was temporary).

The ICIC is increased a few months later to fifteen members, integrating the Japanese physicist Aikutu Tanakadate, emeritus of the University of Tokyo (nominated in December 1926 but seated for the first time at the next session in July 1927). Viscount Ishii, Japanese representative in the Council, explicitly stipulates on this occasion that this candidature is justified by the withdrawal of Inazo Nitobe from his position of director of the Section. This new increase, forced by an influential member of the Council, is the last one to proceed in such an unexpected way: at the beginning of the 1930s, the Committee profoundly reforms its organization as well as that of the Paris Institute. Enacted on September 9, 1930, on the basis of a recommendation of the twelfth session of the ICIC, a new system states that one-third of the Committee must be replaced each year. This de facto reduces the term of office of the members to three years and forces many long-standing members to leave. The number of members is increased to eighteen in 1934, a figure that will now vary only in 1937 to reach nineteen members. Figure 4.1 makes the acceleration of the renewal of the ICIC very visible since 1931: the increase in the number of new arrivals generally varies between three and six per year, whereas it was instead between one and two during the 1920s. This visualization of the mandates’ duration also makes visible the generally stable representation of Ibero-American members (in black on Figure 4.1, see also Figure 4.2). It also shows that the year 1930 is a real turning point in terms of the representation of the concerned countries. Indeed, while the 1920s still see two or three terms overlap, the arrival of the Columbian journalist and ambassador Baldomero Sanín Cano and the Spanish law professor José Castillejo in 1931 happens as all their Ibero-American colleagues leave, creating a steep transition for this “cultural group”.

While the Brazilian Aloysio de Castro demonstrates a long-standing commitment to the ICIC, since he remains there for the entire decade, his early Spanish colleague Leonardo Torres y Quevedo is replaced in 1926 by Julio Casares, a journalist and lexicographer who is a member of the Spanish delegation to the League and had already replaced him during the last three years. The third seat created for the Spanish-speaking Americans in 1924 is filled again after the departure of the Argentinian Leopoldo Lugones by the Peruvian senator and professor of sociology
Figure 4.2: Comparison between a) the Proportion of Ibero-American Members Officially Appointed; b) the Proportion of Them Really Attending the Sessions (Without Substitutes); c) the Proportion of All Ibero-Americans Attending the Sessions Among All Participants (Members, Substitutes, Delegates, Secretaries, etc.).

Mariano Cornejo Zenteno in 1929. But the latter remains only two years in the Committee. With Castillo replacing Casares, the Spanish delegation is still present after the turn of 1930, while Cornejo’s South American seat moves from Peru to Colombia. But it will be necessary to wait for the appointment of the president of the Portuguese Academy Julio Dantas in 1934 for the Portuguese language to once again be represented at the ICIC. Rarely present, Sanin Cano is replaced in 1936, and his seat returns to Peru with the appointment of the writer and diplomat Francisco García Calderón Rey. The very last session of the Committee, finally, sees the appointment of the Brazilian Miguel Ozório de Almeida and the Argentinian Victoria Ocampo. The first will therefore sit only once, while the second is not even present in Geneva in 1939.

Compared to Official Balance, a Weaker Ibero-American Real Presence

To list the members of the ICIC is a duty for most of the researchers who have attempted to describe the Committee without limiting themselves to the initial composition of 1922. Thus, if Bekri (1990, 343–48) and Lühr (2010, 286–88) reproduce the list established by Pham (1962) without modifying it, probably on the basis of Council documents, Renollet (1999, 184–185) draws up a table whose data are more faithful to the documents of the Committee. But it is limited to mention the officially
appointed members. Based on the minutes of the twenty-one sessions, which accurately describe participants' attendance and absences, Figure 4.1 confronts this data with a reality that quick statistical studies do not generally take into account: the repeated absence of some members considerably modifies the balance and almost nullifies the conclusion based on the official presence of the experts. As trying to understand the composition of the ICIC also means highlighting the “minor” participants of these sessions (the many substitutes, secretaries, delegates of national commissions or other institutions), taking the attendance rate into account gives very useful quantitative information to qualify the investment of each one, if not in the global work of intellectual cooperation, at least in these annual sessions that can be considered the backbone.

To sit for many years does not always mean to be actually present during the sessions: among the twelve personalities who benefit from a mandate covering ten sessions or more, only five concretely participate at least ten times. In terms of actual attendance, there is indeed a two-speed Committee, between the members who attend almost all the sessions for which they are elected and those who are absent most of the time. Among the first absentees, Albert Einstein is particularly exemplary—since if we exclude the two sessions of 1923 consecutive to his temporary resignation—he takes part only in one out of two sessions until his definitive resignation in 1932. It is, however, George Hale’s substitute, Robert A. Millikan, who appears to be the most absent during the first decade of the ICIC since he only attended a quarter of the sessions. The representation of the United States of America is all the more diminished in the Committee, as the compatriot replacing Millikan in 1933, the professor of history at Columbia University James T. Shotwell, is no more assiduous since he only attends two sessions out of seven until 1939. Is this the sign of a lack of interest or material and temporal constraints? While it is true that it is easier for the Swiss Gonzague de Reynold to attend sessions in Geneva or Paris than for a South American or Asian scientist, our analysis shows no conclusive correlation between distance and absenteeism (personalities living in India or Japan are very present for instance). This observation should remind us that the nationality of a scientific or diplomatic personality participating in the works of the League of Nations is only a very vague indicator of the real distance they travel to join the sessions: many of them are attached to European universities or an embassy near Geneva.

Unlike those who are rarely present, others are active participants, such as the philologist Julio Casares (Madrid) who, because he is part of the Spanish diplomatic delegation to the League, replaces his fellow Leonardo Torres y Quevedo four times before sitting himself for the next five sessions, without any absence.

Overall, the increase in the number of members, from a minimum of twelve to a maximum of nineteen, does not change the total attendance

Proportion of Ibero-American Members & Proportion of Them Really Attending Sessions; c) the Proportion of All Sessions Among All Participants (Members, delegates, etc.).

But the latter remains only two years replacing Casares, the Spanish delegate 1930, while Cornejo’s South America. But it will be necessary to wait until of the Portuguese Academy Julio language to once again be represented Cano is replaced in 1936, and his attendance of the writer and diplomat in the very last session of the Committee, the Brazilian Miguel Ozório de Almeida - pò. The first will therefore sit only present in Geneva in 1939.

Weaker Ibero-American

duty for most of the researchers who committee without limiting themselves. Thus, if Bekri (1990, 245–48) and list established by Pham (1962) with the basis of Council documents, Renollet whose data are more faithful to the it is limited to mention the officially
rate at ICIC sessions. It usually varies between 60% and 80%, with two occurrences below the 50% mark: the fifth session, “convened fairly quickly” in May 1925, where only six out of fourteen members are present, and the twentieth session in July 1938, where seven out of seventeen members actually sit. On this occasion, president Gilbert Murray wonders if he shouldn’t rejoice in this situation “since it allows the Committee to enter into relations with other remarkable personalities who replace them”.

And in terms of absenteeism, how are Ibero-American members performing? Here, taking these nationalities as a category only makes sense in a study of their international networks and in relation to the assumption that they represent a “cultural group” in the sense of the 1920s. It is therefore not a question of comparing their representation to that of other national or groups (since the coherence of the Spanish- and Portuguese-speaking group is very relative, and defining these other groups is also ambiguous) but rather of comparing its evolution in time. The first of the curves of Figure 4.2 indicates, session after session, the proportion of these personalities appointed to the ICIC. This is a theoretical value that tells us about the official balance and the place left to the representation of Ibero-American nations. If the evolution is relatively stable over time (between two and three representatives, exceptionally four in 1939), there is an obvious disparity between the nations since Spain is systematically represented in the Committee from 1922 to 1938. The remaining one or two seats go to representatives of Latin America until the appointment of the Portuguese Júlio Dantas in 1934 (during the next five years, the Iberians are more numerous than the Latin Americans). In fact, Spanish-speaking experts are still largely in the majority even though there are officially only three sessions without Portuguese-speaking experts (the latter having a higher rate of absenteeism).

The second curve of Figure 4.2 completes the first one since it takes the absences into account, in proportion to the real presence of all ICIC official members. As a result, on rare occasions (the second and sixteenth sessions, in particular) the actual proportion of Ibero-Americans exceeds the theoretical proportion due to the absence of many other members of the Committee. But, on average, these representatives are less present in person than their colleagues. The graphs also state that at the fifth session (1925), no Ibero-American experts were present.

The third curve of Figure 4.2 covers all the people attending the Committee’s sessions, including substitutes, international civil servants and invited experts of diplomats. If their presence is significant enough in the second half of the 1930s, it is clear that Ibero-American are very largely underrepresented, especially among the auxiliary actors that will be the focus of the following paragraphs.
between 60% and 80%, with two exceptions: the fifth session was convened in July 1938, where seven out of seventeen representatives were Ibero-American. This is remarkable considering the fairly small number of Ibero-American members of the League of Nations, which makes sense given the category of representatives as defined by the League. The situation is different from the situation in other international organizations, where Ibero-Americans have been significantly more represented in the ICIC, as they have often also served as substitute representatives from third-party institutions. This is especially true for the Ibero-American Networks, where Ibero-Americans have been represented more than in other organizations.

Beyond the Official Members, a Multitude of Other Participants

In the shadow of scientific and political figures, whose brilliance is never forgotten in the written history of the institution, hides a population at least three times more numerous: the substitute representatives, secretaries and delegates from third-party institutions. And their importance is all the more crucial for the ICIC, as they—in addition to ensuring the link with the other bodies of the League of Nations and beyond—are sometimes the guarantors of the continuity of the work and spirit of intellectual cooperation. These personalities are anything but “secondary characters”. Even if their names are rarely recalled in this context, it is of course among the international civil servants of the Secretariat of the League that we find the individuals who concretely “make” the intellectual cooperation on a daily basis, a statement corroborated by a systematic analysis of the archives of the Committee (GrandJean 2017, 389-390). To these members of the Secretariat are added representatives of the International Labor Office, experts convened to deal with technical questions or the direction of the Paris IIIIC after its creation. But if we concentrate on Spanish and Portuguese-speaking personalities, who are not widely represented among these categories of international civil servants, two main groups emerge. In the first place, the substitutes are the most important group since the absences of certain members makes it necessary to ask many colleagues or diplomats to serve temporarily. Then there are the representatives of the “national committees” of intellectual cooperation (NCICs), structures created by the national academies or universities in the most active countries at the request of the ICIC. They serve as local relays and, from time to time and especially from 1933, are solicited by the League and invited to participate in the plenary sessions. It often happens that the most prominent personalities of these national committees are also those that the titular members choose to replace them.

The Venezuelan diplomat Alberto Zérega Fombona, professor in Caracas and Paris, is the first to replace an Ibero-American member of the Committee when he participates as Castro’s substitute in 1923. He is followed by the Uruguayan writer Juan Antonio Buero, delegate to the Pan-American conference in Santiago de Chile in 1923 and senator, who replaces Lugones in 1925. Replacing Castro in 1926, the Brazilian diplomat Elizeu de Montarroyos will also participate in the works of the ICIC in 1934 and 1938 as a delegate from the Brazilian NCIC. The same year, Lugones is replaced by the Argentinean vice-consul in Geneva Alejandro Unsain and the next year by the Ecuadorian writer and ambassador in Paris Gonzalo Zaldumbide, who will come back twice in 1934 and 1935 as a delegate from his state. In 1927, the Brazilian senator and engineer Paulo de Frontin, director of the Polytechnic school of Rio de Janeiro, sat as substitutes for Castro. This latter is replaced two years later by
the Brazilian physician and writer Júlio Afrânio Peixoto, member of the Brazilian Academy and Parliament, professor at the University of Rio de Janeiro and member of the Brazilian NCIC.

The arrival of Baldomero Sanín Cano in 1931 is synonymous with many replacements since he only personally attends one in five sessions. The Colombian writer Antonio José Restrepo acts as his substitute in 1932, followed by the pedagogue Agustín Nieto Caballero in 1934 and the Chilean delegate to the Assembly and writer Manuel Rivas Vicuña in 1935. During the last years of the ICIC's work, García Calderón is also replaced by the plenipotentiary secretary in Switzerland Victor Andrés Belaúnde (1936); Dantas by the Portuguese writer Virgínia de Castro e Almeida, member of her country's delegation to the League (1937–1938) and Ocampo by the Argentinian delegate Carlos Alberto Pardo, already present the year before as an external expert (1938–1939). A significant proportion of these personalities are also members of their national committees, but we note that some individuals also participate directly as representatives of their NCIC. In 1934, this is the case of the Mexican senator Pedro de Alba, assistant director of the Union of American Republics (Pan American Union) and delegate to the Assembly. And, in 1938, the Chilean NCIC is represented by the law professor Francisco Walker Linares, correspondent of the Information Section and delegate.

But to understand the implication of these apparently peripheral personalities in the work of the ICIC, such a list is not sufficient since it does not reflect the context in which they participate in the sessions. This is why a structural analysis (Grandjean 2014) is necessary to bring out information that not only describes the mere presence of an individual at one or more sessions of the Committee but also allows us to show the relations that are woven together when two are attending the same sessions. Figure 4.3 visualizes these co-presence relationships as a network of the 212 individuals who took part in at least one of the twenty-one sessions of the ICIC.

In this network diagram, two people are connected by an edge if they participate in the same session. The size of the edge is directly proportional to the number of co-presences of the two individuals connected. For example, Aloysio de Castro is connected by an edge more than twice as thick to Júlio Casares as to Leonardo Torres y Quevedo since he sits five times with the first and only twice with the second. If this data visualization concerned only the members of the Committee, the network would be perfectly redundant with Figure 4.1 since this information is already contained in the attendance list. However, this network is now based on a complete inventory of those who participated in the sessions, highlighting the very large proportion of non-ICIC members and their sometimes much more central position than some regular members often absent. Note also that the size of the nodes is proportional to the number of sessions the individuals attended. We remark the presence of
Afrânio Peixoto, member of the professor at the University of Rio de NCIC.

Lazo in 1931 is synonymous with personally attends one in five sessions. Restrepo acts as his substitute in 1934 and writer Manuel Rivas Vicuna in IC’s work, García Calderón is also secretary in Switzerland Victor Andrés Portuguese writer Virginia de Castro e delegation to the League (1937-1938) delegate Carlos Alberto Pardo, already expert (1938-1939). A significant are also members of their national individuals also participate directly 1934, this is the case of the Mexican director of the Union of American delegate to the Assembly. And, in addition to the law professor Francisco Information Section and delegate. of these apparently peripheral persons such a list is not sufficient since they participate in the sessions. This statement (can 2014) is necessary to bring out the mere presence of an individual committee but also allows us to show the there are attending the same section presence relationships as a network and in at least one of the twenty-one people are connected by an edge if they size of the edge is directly proportional of the two individuals connected. connected by an edge more than twice Pardo Torres y Quevedo since he sits twice with the second. If this data visualisers of the Committee, the network Figure 4.1 since this information is list. However, this network is now those who participated in the composition of non-ICIC members and position than some regular members of the nodes is proportional to the attended. We remark the presence of a myriad of poorly connected people in the margins: more than half of the people who participated attended only one session (58%). And while the majority of them are delegates of national committees or occasional substitutes, there are still about ten ICIC members among them. The structure of the network naturally depends very much on the temporality of the Committee: as most members, experts or secretaries

Figure 4.3 Network of the 212 Participants in ICIC Meetings Between 1922 and 1939.
usually sit during one to five years, the neighborhood of an individual is logically composed of people who participated in the activity of the ICIC during the same period as he. At the top, we find the main members of the first Committee of 1922, around their first president Henri Bergson and under-secretary general Inazo Nitobe. This group is densely connected with the region of the graph containing more central characters, Jules Destée, Kristine Bonnevie, Julio Casares and Marie Skłodowska-Curie in the first place, who will all remain in the Committee until 1930 (and after the departure of the first two presidents). The separation with the newcomers of 1931, including, for example, the philosopher and future Indian Prime minister Sarvepalli Radhakrishnan or José Castillejo, is quite clear: it is Gonzague de Reynold, Gilbert Murray and the former Czech minister and history professor Joseph Susta (the latter entered in 1928 and thus met a good part of the original members) who are acting as an interface between the former ICIC, above, and the new one at the bottom.

This comprehensive approach also highlights several Spanish or Portuguese-speaking personalities who do not attend sessions as substitutes or delegates of a NCIC. Taking part in five sessions between 1931–1934 and in 1939, the Franco-Brazilian journalist and writer Dominique Braga is more present at ICIC meetings than many official members! His position of technical advisor on literary questions at the Parisian IIIC (Dumont 2008, 105–146) makes him one of the most active representatives of the Portuguese language in the circles of intellectual cooperation. But several Spanish personalities are also part of the occasional participants. This is the case of the professor of law and delegate to the League Manuel Martínez Pedrosa, who attends the meeting of 1933 on behalf of the Committee on moral disarmament. In 1935, Blas Cabrera represents the Council of scientific unions, followed by Salvador de Madariaga in 1938 and 1939 on behalf of the International Museums Office (dependent on IIIC), and Felix Vejarano serving as a member of the secretariat of the International Bureaux Section of the League in 1939 as well. With regard to other nationalities, we note the presence of the permanent Venezuelan delegate Manuel Arocha in 1936 and the Argentinian writer and diplomat Roberto Gache the same year.

But whatever the reason for their involvement, Ibero-American personalities rarely occupy central positions. Representing 15% of the total number of individuals having attended an ICIC session, few can boast of having sat with a significant number of colleagues. This is, for example, the case of Casares or Castro, but also of people like Montarroyos or Zaldumbide who, because they each participated in three sessions of the Committee, far exceed regular members such as Lugones, Gormeo or Samín Cano. García Calderón’s situation is structurally interesting because having a big gap between his first participation (replacing Lugones in 1923) and his last (official Peruvian member in 1939), he collects a network of
The neighborhood of an individual is also extensively interconnected with more central characters, Jules Casares and Marie Sklodowska-Curie, who participated in the Committee until 1930 (and there are many). The separation between the two examples, the philosopher and future Nobel laureate, Joseph Susta (the latter entered in 1925) and Gilbert Murray and the former president of the League of Nations, Blas Cabrera, represents a larger revolution in the ICIC, above, and the new role of the American historian Waldo Leland, who replaces Robert A. Millikan in 1923 to return only in 1935, 1937 and 1938 to replace the intellectual and political scientist James T. Shotwell.

Conclusion: The Late Rise of the Latin American Countries

The active and long-term involvement of experts such as Aloysio de Castro, Júlio Casares or José Castillejo, and Joan Casares and José Castillejo, however, does not allow us to conclude that the Ibero-American world has been globally represented in a satisfactory way in the International Committee on Intellectual Cooperation. In the late 1930s, the leaders of intellectual cooperation gradually seek to preserve their achievements, in particular by conferring to the post- League of Nations period. While the League suffers from its repeated diplomatic failures in the course of the 1930s, the actors of intellectual cooperation gradually seek to preserve their achievements, in particular by conferring to the Parisian IIIC an increased autonomy that would allow it to continue its activity if the states all withdrew from Geneva. In July 1937, a large meeting of National Committees, ICIC and IIIC directors therefore validates “the study of an intergovernmental agreement [...] whose purpose would be to offer other governments interested in intellectual cooperation the possibility of associating themselves with the commitments made by the French Government”.

Clearly, it is therefore a question of bypassing the League of Nations, still the place where the States are supposed to meet, so that they sign without its intermediary an international act guaranteeing an independent financing of the IIIC. Elizeu Montarroyos, who is close to the ICIC since he participated in three sessions and is the Brazilian delegate to the IIIC, proclaims during this meeting that “it is [...] a marriage, a union of Intellectual cooperation with the Governments.”

Despite the appearance of a “coup from the base against the Secretariat” (Renollet 1999), the Assembly of the League validates this proposal and therefore convenes a diplomatic conference to be held the following year at the Quai d’Orsay in Paris.

In December, forty-five nations take part in the diplomatic conference by delegating a plenipotentiary, but the composition of this new coalition is very different from the balance that prevailed in the ICIC. Western
Europe only represents a quarter of the participants (whereas in the same year it holds more than 40% of the seats in the ICIC). The largest contingent of this diplomatic conference comes from Latin America (one-third), despite—and perhaps in reaction to—the very low representation of this continent in the ICIC (6% in 1938). With Argentina, Brazil, Chile, Colombia, Costa Rica, Cuba, the Dominican Republic, Ecuador, Guatemala, Haiti, Mexico, Panama, Paraguay, Peru, Uruguay and Venezuela, this Latin American delegation shows an increase in the diversity of actors interested in intellectual cooperation at a time where several major European powers are divesting themselves (note that Spain and Portugal are present at the diplomatic conference). And, for the first time, a Latin American has an official responsibility: the Peruvian Francisco García-Calderón is one of the four vice-presidents of the conference.43

On December 3rd, 1938, less than half of the States signed the Act. Among the twenty-one nations ready to rebuild the IIIC, France is finally the only major Western power to carry the project, alongside China, Spain, the Netherlands, Switzerland, Portugal, Egypt, Poland, Romania, Monaco and ten Latin American States: Argentina, Brazil, Chile, Cuba, the Dominican Republic, Ecuador, Paraguay, Peru, Uruguay and Venezuela. And yet they must ratify the act, a procedure whose duration varies greatly from one State to another. On May 1st, 1939, thirty-seven states signed the act, but eleven of them—including Portugal and Mexico—actually ratified it. The international act thus officially enters into force on January 31, 1940, and is then promulgated by the French government a month later. But the International Institute of Intellectual Cooperation is no longer active, most of the meetings having been postponed, and will be closed on June 9, a few days before the German troops enter Paris.

Less affected by the Second World War, Latin America will be a fertile ground for many initiatives inspired by the activities of the ICIC and the IIIC, such as the repeated plans to create an Inter-American Office or Institute, in discussion since 1929 and about to materialize in 1943 in La Havana.44 The “Pan-American Conference of Intellectual and Cultural Cooperation” is organized in the same city in November 1941 (Perret 2014, 349–354), and IIIC Director Henri Bonnet participates, having left Paris for the United States.45 This third period, which sees the legacy of the ICIC and its Institute springing again momentarily in Latin America, outside the institutions of global (European) governance, suggests that the political bickering of the old European nations within the League—and especially France’s flagrant seizure of intellectual cooperation—were all obstacles to the development of a genuine grassroots movement, where intellectuals can organize themselves and for themselves.

Notes
